  AB - PROBLEM TO BE SOLVED: To provide a system and a method for receiving
        calendar information obtained from various source documents
        having respectively different formats, analyzing the received
        information and managing a data base.
      - SOLUTION: An event data base 310 is prepared based on information
        extracted from a ***calendar*** document 314. Related information can
        be simply extracted from the document 314 by guidance to be other
        regulation related to the structure and contents of a user input, a
        document ***template*** or the document 314.

  IC1 - ***G06F-009/46***
  AB - PROBLEM TO BE SOLVED: To ***schedule*** a linked event having fixed
        and dynamic conditions.
      - SOLUTION: An event and event group are checked at ***scheduled*** time
        so that fixed conditions related to the event can be met. The event is
        also checked at ***scheduled*** time called 'execution setup time' and
        during execution of the event (when the event is executed). At
        execution setup time, a certain dynamic condition and data related to
        the event are checked for whether or not the dynamic condition is met.
        When the dynamic condition is met, the execution of the event is
        confirmed. When an unmet dynamic condition exists, the event is
        changed. The event can be changed through cancellation, postponement,
        etc. When the event is changed, a notice can be sent. When the event
        is changed, in addition, the change extends to the succeeding events
        in the event group (propagation). A ***template*** 265 constitutes an
        event group 260 containing some abbreviated information provided from
        a user at the ***scheduled*** time. The ***template*** 265 is used for
        making the ***scheduling*** of a general event and event group easier.
